

Dock Sides Receiver Selection

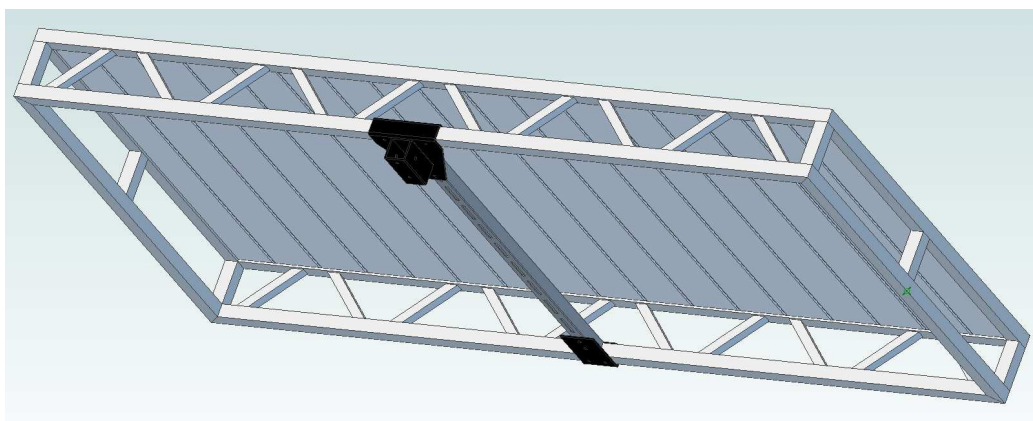

As was stated in the overview, there are three Dock Sides Receiver variations to accommodate mounting to your particular dock or deck style:

- Clamp with cross beam mounting bracket – for mounting to a truss style side rail aluminum or steel dock
- Slotted with cross beam mounting bracket – for mounting to a solid side rail aluminum or steel dock
- Slotted – for mounting to a wooden or metal frame dock with structural cross members

Once mounted to your dock or deck, the Dock Sides attachments are simply slid into the Receiver and pinned with a quick release pin, which is included. The ease of mounting Dock Sides attachments to the Receiver allows quick and easy swapping of attachments to reconfigure your dock or deck based on your desired activity - no tools required.

The illustrations below depict the application of the three receiver types.

CLAMP RECEIVER WITH CROSS BEAM

The Clamp style receiver easily slides onto the bottom rail of truss style docks and is secured in place by tightening two set screws. It is easy to install and remove, allowing you to easily relocate the receiver to a different location on your dock if needed.

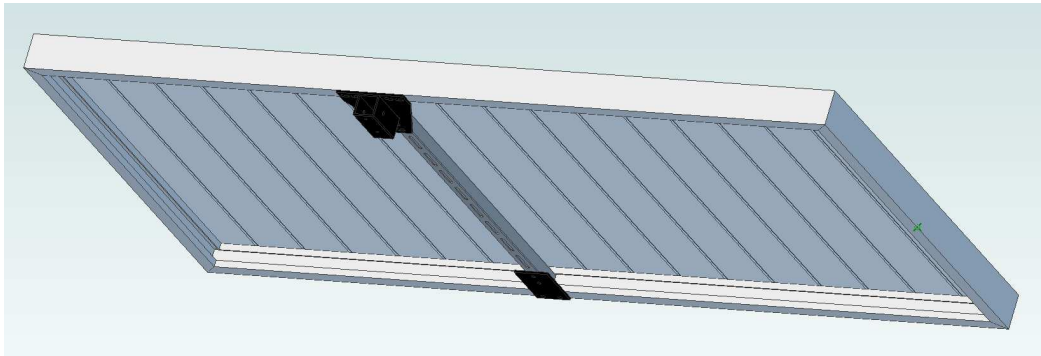

This is an especially good solution for FLOE, Hewitt Roll-A-Dock, Pier Pleasure Roll-In, Porta-Dock Roll-In and Floating, and Shoremaster Infinity docks, It also works well with most any truss style dock.

The Clamp style receiver is composed of three components:

- The Clamp Receiver itself, which is installed on one side rail of the dock and mounts the Dock Sides accessories
- The Clamp Bracket, which is installed on the opposite side rail of the dock
- The Cross Beam, which attaches between the Clamp Receiver and Clamp Bracket and provides load support for the Dock Sides accessories mounted to the Clamp Receiver.

SLOTTED RECEIVER WITH CROSS BEAM

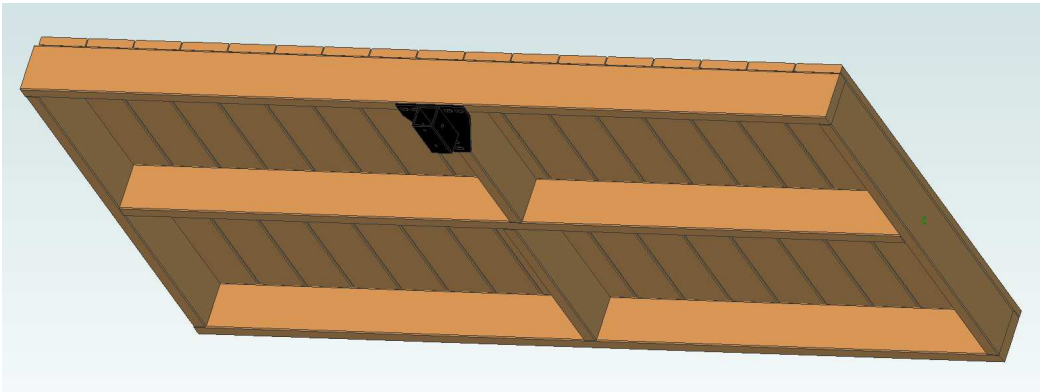

The Slotted style receiver coupled with the cross beam mounting bracket provides a secure mounting solution for solid side rail docks. The assembly mounts on the side rails of solid rail style docks and is secured to the side rails with two bolts on each side.

The Slotted style receiver with cross beam is composed of three components:

- The Slotted Receiver itself, which is installed on one side rail of the dock and mounts the Dock Sides accessories
- The Mounting Bracket, which is installed on the opposite side rail of the dock
- The Cross Beam, which attaches between the Slotted Receiver and Mounting Bracket and provides load support for the Dock Sides accessories mounted to the Slotted Receiver.

SLOTTED RECEIVER

The Slotted style receiver mounts to the underside frame of wood frame and certain metal frame style docks and is secured in place by six lag screws for wood frames or six bolts for metal frames. This receiver provides a strong platform for mounting all the Dock Sides accessories, including the 5' bench and up to 13' side mount umbrellas.
